Translation Of Er Model To Relational Schema

I have the following ER Model. I am trying to convert this to a relational database schema but I am not sure about several things. An ER schema as the result of a translation from a relational schema will have more semantics.

The goal of design is to generate a formal specification of the database schema. Use the E-R model to get a high-level graphical view of the essential components.

Consider schemata and states for both data models: ER schema, ER states, transformation, and relational schema. The translation of an ER diagram into a set of rules converts each element of the ER schema to a corresponding relational database schema.
